There are some cases where this simple relation should not be applied. Furthermore, this reference offers modeling techniques for loads in a probabilistic manner.

In general, the corrosion process can be divided into two stages: Methodology

This project focuses on the inclusion of spatially variable parameters in reliability analyses of unreinforced and reinforced concrete structures and the adaptation of structural reliability methods for the specific use on hydraulic structures. For each one of these C.

According to these results, cover depth value of 10mm is not recommended, because it indicates failure reliability index lower than the target even for short time after construction. Moreover, this number of mechanical model runs is the highest observed among all scenarios considered.
